1 Biomechanical topics in soft tissues	23
1.1 Introduction	23
1.2 Diffusion, convection, osmosis: towards wearable artificial kidneys	24
1.3 Issues in drug delivery	25
1.4 Macroscopic models of tissues, interstitium and membranes	27
1.5 Energy couplings, passive and active transports	28
1.6 More general direct and reverse couplings	29
1.7 Tissue engineering re-directed to tumor tissue exploration	29
1.8 From mechanics to biomechanics	30
1.9 Mechanisms of injury of the knee, fracture mechanics	31
1.10 Water and solid constituents of soft tissues	33
 I Solids and multi-species mixtures as open systems : a continuum mechanics perspective	 35
2 Elements of continuum mechanics	37
2.1 Algebraic relations and algebraic operators	38
2.1.1 Notations and conventions for tensor calculus	38
2.1.2 Algebraic operators	39
2.2 Characteristic polynomial, eigenvalues and eigenvectors	42
2.2.1 Eigenvalues and eigenvectors	42
2.2.2 Characteristic polynomial of a second order tensor	43
2.2.3 Scalar invariants of the stress deviator	44
2.2.4 Spectral analysis of a symmetrized dyadic product of two vectors	46
2.3 A few useful tensorial relations	47
2.3.1 Cayley-Hamilton theorem	47
2.3.2 Application to the polar decomposition $\mathbf{F} = \mathbf{Q} \cdot \mathbf{U}$	47
2.3.3 Generalized Cayley-Hamilton relation	48
2.3.4 The tensor equation $\mathbf{X} \cdot \mathbf{A} + \mathbf{A} \cdot \mathbf{X} = 2\mathbf{S}$	48
2.3.5 Rank one and rank two modifications of the identity	49
2.3.6 Square-root of a positive definite symmetric second order tensor	50
2.4 The differential operators of continuum mechanics	51
2.4.1 Definitions of the differential operators	51
2.4.2 Application to kinematics	55
2.4.3 Spherical, cylindrical and polar coordinates	56
2.4.4 Convective acceleration	61
2.5 Measures of strain	63
2.5.1 Polar decomposition of the deformation gradient	63
2.5.2 Spectral decomposition of the right and left Cauchy-Green tensors	63
2.5.3 Lagrangian and Eulerian strain measures	64

2.5.4	Rate of deformation and rates of strain measures	64
2.5.5	Representation theorems for rotations	65
2.5.6	Infinitesimal strains	69
2.5.7	Volume change and incompressibility	70
2.6	Transports between reference and current configurations	70
2.7	Time derivatives and Reynolds theorems	73
2.8	Work-conjugate stress-strain pairs	75
2.8.1	Stress conjugate to a given Lagrangian strain measure	75
2.8.2	Issues related to the logarithmic strain	76
2.9	Small upon large	77
2.10	Kinematical constraints and reaction stresses	78
2.11	Invariance, objectivity, isotropy	79
2.11.1	Tensor invariance	80
2.11.2	Material frame indifference or material objectivity	80
2.11.3	Material symmetries	84
	Exercises on Chapter 2	90
3	Thermodynamic properties of fluids	95
3.1	Basic thermodynamic definitions	95
3.1.1	Open and closed systems. Intensive and extensive properties	95
3.1.2	Energy, free energy, enthalpy, free enthalpy, Legendre duals	96
3.1.3	Chemical equilibrium between two multi-species phases	97
3.1.4	The Gibbs-Duhem relation	98
3.1.5	Chemical affinity associated with a chemical reaction	99
3.1.6	Chemical equilibrium versus steady state	100
3.1.7	Flux- and energy-driven chemical reactions	100
3.2	Phase change	102
3.2.1	Phase change and the Clapeyron formulas	102
3.2.2	The principle of Spite and the Kelvin-Helmholtz formula	105
3.2.3	The time course of a desiccation process	107
3.2.4	Negative pressures, metastability and cavitation	108
3.3	Thermodynamic functions of fluids	109
3.3.1	The perfect or ideal gas	110
3.3.2	Compressible and incompressible liquids	111
3.3.3	Explicit thermodynamic functions for liquids	112
3.3.4	Liquid-vapor equilibrium curve: IAPWS and simplified formulations	118
3.4	Laplace's law of mechanical equilibrium at the interface between two immiscible fluids	123
3.5	Henry's law and Raoult's law of chemical equilibrium between a liquid and a gas	124
3.6	Composition of fluids in plasma, interstitium, cell	125
4	Multi-species mixtures as thermodynamically open systems	129
4.1	The thermodynamically open system	130
4.2	Chemomechanical behavior and growth of soft tissues	130
4.3	General form of balance equations	134
4.3.1	Partial, apparent and intrinsic properties	134
4.3.2	Mass, geometry and kinematical descriptors	134
4.3.3	Integral and local balance equations	135
4.4	Balance of mass	137
4.4.1	Balance of mass for species	137
4.4.2	Balance of mass for the mixture	138
4.4.3	Diffusion, mass transfer and growth	138
4.5	Balance of momentum	139
4.5.1	Balance of momentum for species	139
4.5.2	Balance of momentum for the mixture	140
4.5.3	Interaction momenta	141
4.5.4	Interaction stresses	141
4.6	Balance of energy	142
4.6.1	Notation of thermodynamic functions in a mixture context	142

4.6.2	First principle of thermodynamics	143
4.6.3	Balance of energy for species	143
4.6.4	Balance of energy for the mixture: direct derivation	144
4.6.5	The case of an electrolyte	146
4.7	Balance of entropy and Clausius-Duhem inequality	146
4.7.1	Balance of entropy for species	147
4.7.2	Internal and external entropy productions for a species	147
4.7.3	Second principle of thermodynamics	149
4.7.4	The Clausius-Duhem inequality	150
4.8	Dissipation mechanisms	153
4.8.1	Dissipation due to generalized diffusion and transfer	154
4.8.2	Spontaneous reactions and stable configurations	154
4.8.3	Coupled chemical reactions	156
4.8.4	Dissipation associated with a chemical reaction	157
4.8.5	Are growth and structuration dissipative processes?	158
4.8.6	Onsager relations and rate potential	158
4.9	General constitutive principles	159
	Appendices of Chapter 4	161
5	Anisotropic and conewise elasticity	165
5.1	Hypoelasticity, elasticity and hyperelasticity	166
5.1.1	A hypoelastic material	167
5.1.2	An elastic material	168
5.1.3	A particular hyperelastic material	168
5.2	Anisotropic linear elasticity	169
5.2.1	Matrix representation	169
5.2.2	Minor and major symmetries	170
5.2.3	Microstructure and symmetry groups	170
5.2.4	From anisotropic to isotropic linear hyperelasticity	173
5.2.5	Linear isotropic elastic materials	176
5.2.6	Linear orthotropic elastic materials	177
5.2.7	Prestress/prestrain in linear hyperelastic materials	180
5.2.8	Linear transversely isotropic elastic materials	180
5.2.9	Linear cubic elasticity	183
5.2.10	Saint-Venant's relations for linear elasticity	184
5.2.11	A particular elastic material with fabric anisotropy	184
5.3	Spectral analysis of the elastic matrix	186
5.3.1	Spectral analysis: linear elastic isotropic materials	187
5.3.2	Spectral analysis: linear elastic transversely isotropic materials	187
5.3.3	Spectral analysis: linear elastic orthotropic materials	188
5.4	Fiber-reinforced materials: extension-contraction response	189
5.4.1	Basic remarks on the mechanical response of fiber-reinforced tissues	189
5.4.2	Conewise constitutive response: generalities	190
5.4.3	Application to materials with one family of fibers	191
5.4.4	Application to materials with two families of fibers	191
5.4.5	Application to linear orthotropic materials: octantwise response	192
5.4.6	Application to transversely isotropic materials	194
5.4.7	Application to isotropic materials	194
5.4.8	Cartilage as a tissue with cubic symmetry	194
5.4.9	Cartilage as an orthotropic tissue	194
	Exercises on Chapter 5	198
6	Hyperelasticity, a purely mechanical point of view	209
6.1	Restrictions to the strain energy function	210
6.1.1	Mathematical requirements	210
6.1.2	Constitutive requirements of mechanical nature	211
6.2	Properties of constitutive functions and partial differential equations	211
6.2.1	Positive definiteness	212

6.2.2	Ellipticity and Strong Ellipticity	213
6.2.3	Convexity	215
6.2.4	Polyconvexity	216
6.3	Total potential energy	217
6.4	Isotropic hyperelasticity	218
6.5	Anisotropic hyperelasticity and Fung's strain energy	220
6.5.1	Exponential strain energy	220
6.5.2	Locking versus softening materials: exponentials and energy limiters	221
6.5.3	Strong Ellipticity of Fung's like strain energies (SE)	222
6.5.4	Convexity of Fung's like strain energies	224
6.6	Elastic potentials with the elastic-growth multiplicative decomposition	224
6.6.1	Isotropic Fung's like potentials	225
6.6.2	Multiplicative volumetric-isochoric decomposition of the deformation gradient	226
6.6.3	Additive decomposition of anisotropic Fung's like potentials	227
6.7	Return to the conewise response in presence of fibers	229
6.8	Elasticity and workless constitutive stress	229
6.9	Use of right and left Cauchy-Green tensors	230
	Exercises on Chapter 6	232
7	Poroelasticity with a single porosity	235
7.1	Geometrical, kinematical and mechanical descriptors	236
7.2	Elements of mixture theory: the level/scale of the species	237
7.2.1	Intrinsic properties of species	237
7.2.2	Entropy production for a species	242
7.3	Anisotropic poroelasticity: a composite material format	243
7.3.1	Mechanical, viscous and inertial couplings	243
7.3.2	Momentum supplies and Darcy's law	244
7.3.3	Temperature dependence of the viscosity coefficient of liquids and gases	246
7.3.4	Momentum supplies, the viscous fluid and Brinkman's law	246
7.3.5	Derivation of the momentum equations via Hamilton's principle	247
7.3.6	Anisotropic poroelasticity in terms of apparent stresses and strains	247
7.4	Anisotropic poroelasticity: drained and undrained properties	253
7.4.1	Constitutive equations in terms of drained properties	253
7.4.2	Constitutive equations in terms of undrained properties	256
7.4.3	Independent measurements	258
7.4.4	Compatibility conditions for isotropic porous media	259
7.4.5	Compatibility conditions for transversely isotropic porous media	260
7.4.6	Compatibility conditions for orthotropic porous media	263
7.4.7	Porous media with fabric anisotropy	264
7.5	Unconfined compression of a poroelastic cylinder	266
7.5.1	Poroelastic field and constitutive equations	266
7.5.2	Axisymmetric deformations independent of the axial coordinate	267
7.5.3	Solution in the Laplace domain	268
7.5.4	Relaxation tests: applied axial strain	270
7.5.5	Creep tests: applied axial load	274
7.5.6	Compendium of Bessel functions	276
8	Viscoelasticity and poro-viscoelasticity	281
8.1	Viscoelasticity, poroelasticity and poro-viscoelasticity	282
8.2	Intrinsic time dependent behavior of collagen fibrils	282
8.3	Complex modulus	283
8.3.1	Storage and loss moduli	283
8.3.2	Time translation invariance	286
8.3.3	The fading memory principle	289
8.3.4	Basics of Laplace-Carson transform	289
8.3.5	Loss coefficient and hysteresis loops	290
8.3.6	Complex modulus of the standard linear solid model	291
8.4	Relaxation spectrum	292

8.4.1	A discrete spectrum	292
8.4.2	A continuous spectrum	293
8.4.3	A specific relaxation spectrum	294
8.5	The quasi-linear viscoelasticity QLV model of Fung	295
8.5.1	Elastic response and reduced relaxation function	295
8.5.2	The three-dimensional reduced relaxation tensor	296
8.6	Overall viscoelastic properties: ECM and a contractile cell	296
8.7	An electrical analogy applied to the corneal endothelium	297
8.8	Fluid infusion in a viscoelastic polymer gel	299
8.8.1	Poro-viscoelastic field and constitutive equations	299
8.8.2	The initial and boundary value problem	300
8.8.3	The differential equation for the dilatation, or pressure	301
8.8.4	Radial displacement in a spherical setting	301
8.8.5	The solution in time domain	303
8.9	Confined compression of a viscoelastic polymer gel	306
8.9.1	The solution in the Laplace domain	307
8.9.2	The steady state solution	307
8.9.3	The transient solution	307
8.10	Compression of a poroelastic layer: displacement control	308
8.10.1	The analytical solution	309
8.10.2	The elastic gel as a limit of the viscous gel with a zero relaxation time	310
8.10.3	Inversion of the Laplace transform: the minimum number of poles	310
8.11	Visco-hyperelasticity and other memory effects	310
8.11.1	Linear viscous fluids	311
8.11.2	Maxwell and Kelvin models in a dynamic context	311
8.11.3	Rate effects as non-equilibrium thermodynamically consistent processes	312
8.11.4	Visco-hyperelasticity	314
8.11.5	Long range memory	314
8.11.6	Fading memories in a mixture context	314
8.11.7	Nonlinear viscoelastic models for collagen gels	315
	Exercises on Chapter 8	316
9	Thermoelasticity and thermo-poroelasticity	321
9.1	Thermomechanical properties of elastic solids	322
9.1.1	Isothermal and isentropic moduli	322
9.1.2	Temperature dependence of heat capacity	324
9.1.3	The energy equation of thermoelasticity	325
9.1.4	Cattaneo's heat conductor	328
9.1.5	Cauchy stress versus Eshelby stress	329
9.1.6	Free energy versus Massieu function	329
9.2	Thermoelastic heat, stored energy and dissipated energy	330
9.2.1	A thermomechanical model including an internal variable	331
9.2.2	Plastic work and inelastic heat	332
9.2.3	Plastic work, recoverable and irrecoverable stored energies	333
9.3	Anisotropic thermo-poroelasticity : mechanics, transport, energy	334
9.3.1	Thermodynamic derivation	335
9.3.2	Linear thermo-poroelasticity	335
9.3.3	Coupled flows: thermoosmosis	338
9.3.4	Energy equation of a porous medium in local thermal equilibrium	340
9.4	Generalized compatibility conditions for the stress	341
9.4.1	Compatibility conditions for the stress for linear isotropic elasticity	341
9.4.2	Compatibility conditions for the stress in presence of an inelastic strain	342
9.4.3	Compatibility conditions for spherical problems with radial symmetry	342
9.5	Heating a thermo-poroelastic medium	343
9.5.1	Thermo-poroelastic field and constitutive equations	343
9.5.2	Thermo-poroelastic field equations in a 1D context	345
9.5.3	Prescribed temperature and drained boundary	346
9.5.4	Prescribed temperature and impervious boundary	348

9.5.5	Prescribed thermal flux and drained boundary	348
9.5.6	Prescribed thermal flux and impervious boundary	349
9.5.7	Mechanical output, strain, stress and displacement	350
9.5.8	Simulations, drained and undrained limits	350
9.5.9	Extension of the above model including thermoosmosis	354
9.5.10	Chemo-poroelasticity versus thermo-poroelasticity	354
	Exercises on Chapter 9	355
10	Transfers of mass, momentum and energy	357
10.1	Summary of balance equations	358
10.2	Intercompartment mass transfers	359
10.2.1	Linear mass transfer	359
10.2.2	Mass transfer of electrically charged species	360
10.2.3	Nonlinear constitutive equation of mass transfer	361
10.3	Momentum supply in a poroelastic context	362
10.4	The bioheat equation	362
10.4.1	The bioheat energy equation	362
10.4.2	The bioheat energy equation with a relaxation time	363
10.4.3	Thermal boundary conditions	363
10.4.4	Significance of the Biot number	363
10.5	Mass and energy transfers between a liquid and a solid	364
10.5.1	Constitutive equations for the solid and liquid	364
10.5.2	Constitutive equations for mass and heat transfers	365
10.6	A porous medium with two porosities and three temperatures	366
10.6.1	Thermomechanical equations	368
10.6.2	Generalized diffusion	374
10.6.3	Mass and energy transfers	375
10.6.4	Linear constitutive equations of mass transfer	375
10.6.5	Linear constitutive equations of energy transfer	377
10.6.6	The energy equations	377
10.6.7	The complete set of field equations	379
10.6.8	Increasing and decreasing the degree of sophistication	379
10.7	A porous medium with a single porosity and two temperatures	380
10.8	Interfacial transfer coefficients and specific surface areas	381
10.8.1	Interfacial heat transfer coefficients	381
10.8.2	Specific surface area	383
10.9	The coefficients of transfer: two scale derivation	385
10.9.1	Small scale boundary value problems	385
10.9.2	Heat transfer with a characteristic time	387
10.9.3	Identification of the transfer coefficients	388
11	Waves in thermoelastic solids and saturated porous media	391
11.1	Basic definitions	392
11.1.1	Phase wave and discontinuity wave	392
11.1.2	Lagrangian and Eulerian analyses	393
11.1.3	Hadamard's compatibility relations in the current configuration	394
11.1.4	Conservation laws in a solid domain with a crossing discontinuity	395
11.1.5	Conservation laws in a mixture with a crossing discontinuity	401
11.1.6	Propagation of discontinuities in a solid domain	402
11.2	Waves in elastic solids	405
11.2.1	Jump relations for acceleration waves	405
11.2.2	Acceleration waves in linear isotropic materials	406
11.2.3	Acoustic tensor of a linear elastic orthotropic material	406
11.2.4	Acoustic tensor of a linear transversely isotropic material	407
11.2.5	Acceleration waves in materials with fabric anisotropy	407
11.2.6	Wave motions and Helmholtz potentials in isotropic elastic solids	409
11.3	Acceleration waves in thermoelastic solids	410
11.3.1	Acceleration waves in solid conductors obeying Fourier's heat law	410

11.3.2	Acceleration waves in solid conductors obeying Cattaneo's heat law	411
11.3.3	Acceleration waves in non conductor thermoelastic solids	411
11.4	Acceleration waves and acoustic waves in fluids	412
11.4.1	Acceleration waves in a frictionless ideal fluid	412
11.4.2	Acoustic waves in a frictionless ideal fluid	413
11.4.3	Regimes in the steady irrotational flow in a barotropic fluid	413
11.4.4	A Newtonian viscous fluid	414
11.5	Acceleration waves in saturated porous media	414
11.5.1	The characteristic equation for the wave-speeds	415
11.5.2	Acceleration wave-speeds in isotropic porous media	417
11.5.3	Stationary discontinuity	423
11.5.4	Interlacing and separation properties	423
11.5.5	Inertial coupling: influence on acceleration waves	426
11.5.6	Waves in fluid saturated porous media: pushing the window ajar	428
11.6	Propagation of acceleration waves in saturated porous media	429
11.6.1	Equations of propagation	429
11.6.2	The decaying wave-front	430
11.7	Plane motions and Helmholtz potentials in poroelasticity	431
11.7.1	Displacements and strains in terms of Helmholtz potentials	431
11.7.2	Poroelastic stresses in terms of Helmholtz potentials	432
11.7.3	Field equations in terms of Helmholtz potentials	432
11.7.4	Boundary conditions in a dynamic non dissipative context	433
11.8	Silent poroelastic boundaries	434
11.8.1	Impedance matrix, general case $\lambda^{\text{sw}} \neq 0$	435
11.8.2	Impedance matrix: no poromechanical coupling, $\lambda^{\text{sw}} = 0$	436
11.8.3	Impedance matrix: dry/drained medium	436
11.8.4	Impedance matrix: undrained medium	436
11.9	Surface waves in a saturated porous half-plane	437
11.9.1	Time harmonic solutions decreasing with depth	437
11.9.2	The complete formal solution	438
11.9.3	Frequency dependent dissipation	438
11.9.4	Determination of the coefficients of depth dependence A_j , $j \in [1, 3]$	439
11.9.5	Permeable and traction free surface	440
11.9.6	Impermeable free surface	446
11.9.7	The Kelvin functions ber and bei	449
11.9.8	Surface waves in an elastic half-plane	451
11.9.9	The principle of the argument	453
11.9.10	Descartes's rule of signs	453
11.10	First order waves in saturated porous media	454
11.10.1	Regime of the field equations	455
11.10.2	Form of the solution	456
11.10.3	Discontinuities across the shear Mach line in regions i) and ii)	458
11.10.4	Discontinuities across the longitudinal Mach line in regions i) and iii)	460
11.10.5	Jumps of strains across first order waves	460
11.10.6	Balances of momentum across first order waves	460
	Exercises on Chapter 11	461

II Electro-chemomechanical couplings in tissues with a fixed electrical charge 463

12	Directional averaging for fiber-reinforced tissues	465
12.1	Directional analysis	466
12.1.1	Spatial and directional averaging	466
12.1.2	Directional integration	466
12.2	A simple fiber model for the collagen network	470
12.2.1	A single family of collagen fibers	470

12.2.2	Random directional distribution of collagen fibers	471
12.2.3	Conewise linear stress-strain response of collagen fibers	473
12.2.4	Conewise nonlinear stress-strain response of collagen fibers	476
12.2.5	Random planar directional distribution of collagen fibers	476
12.3	Directional models of tissues	478
12.3.1	Directional distribution of collagen fibers in cornea	478
12.3.2	Continuous planar directional distributions of collagen fibers	479
12.3.3	A directional model of active rod-like cells	481
12.4	The mechanical response of individual fibers	482
12.4.1	The toe region, nonlinearity and fiber uncrimping	482
12.4.2	Intrinsic viscous behavior of collagen fibrils	484
12.5	Fabric tensors	484
12.5.1	Elementary examples of fabric tensors	484
12.5.2	Higher order fabric tensors	486
12.6	Spatial homogenization over cells and ECM	489
13	Electro-chemomechanical couplings	491
13.1	Chemomechanical couplings in engineering and biology	492
13.2	Molar volumes, electrostriction	492
13.2.1	Molar masses and molar volumes	492
13.2.2	The molar volume of dissolved salts	493
13.2.3	The molar volume of dissolved ions	494
13.3	Electrokinetic processes	495
13.3.1	Laboratory setups	496
13.3.2	Development of an acid front	497
13.3.3	Electroinjection	497
13.4	Nanosopic aspects	497
13.4.1	The fixed electrical charge	497
13.4.2	Mechanisms due to pH	499
13.5	Hydration, hydrolysis, complexation and solubility	499
13.5.1	Solvation and hydration	500
13.5.2	Hydrolysis and complexation	501
13.5.3	Individual and simultaneous solubilities of NaCl and KCl	504
13.6	Some basic notions of electrostatics	505
13.6.1	Permittivity and relative permittivity	505
13.6.2	Gauss's law and Poisson's equation	505
13.6.3	Characteristic time of electric relaxation	506
13.7	Semi-permeable membrane and osmotic effect	507
13.8	Reverse or Inverse osmosis	509
13.9	Electrical repulsion and electrical shielding	510
13.10	The pore composition in materials with fixed charge	510
13.10.1	Chemical consolidation and swelling in clays	511
13.10.2	Modification of the electrolyte circulating an articular cartilage	514
13.11	The heart muscle and cell electrophysiology	522
13.12	Reverse couplings	522
13.12.1	Mechanoelectric feedback in the heart muscle	523

22.4.4	Heuristic differential equations versus generalized normality rule	994
22.5	A thermodynamically consistent growth law	996
22.5.1	The state of the deposited mass and the free energy of growth	997

22.5.2	Dissipation inequality for the rates of growth and structure variables	997
22.5.3	A growth law based on a convex homeostatic surface	999
22.5.4	The ellipsoidal homeostatic surface	1001
22.5.5	Rate laws for the structure variables	1004
22.5.6	Application to volumetric growth	1005
22.6	Modes of mass deposition and mechanical response	1011
22.6.1	The mechanical state of the newly deposited mass	1011
22.6.2	Free energy of growth for an elastic-growing solid	1012
22.7	Constitutive equations for purely elastic solids	1015
22.7.1	The deposition modes and their free energies	1016
22.7.2	The constitutive equations for the generalized stresses for mode (a)	1017
22.7.3	The constitutive equations for the generalized stresses for mode (b)	1018
22.7.4	The growth rate law for the mass	1018
22.7.5	Rate equations for the structure variables	1019
22.8	Growth of a bar under unconfined tension/compression	1020
22.8.1	Unconfined tension/compression of the bar	1020
22.8.2	The critical load for the bar	1023
22.8.3	The elastic-growing bar versus the elastic bar under tension	1026
22.9	Growth of a hollow cylinder under internal pressure	1029
22.9.1	The thin wall approximation	1029
22.9.2	The hollow cylinder under internal pressure	1029
22.9.3	The critical load for the cylinder	1030
22.9.4	The elastic-growing cylinder versus the elastic cylinder	1030
	Appendices on Chapter 22	1032
23	Elastic-growing mixtures	1035
23.1	Thermodynamically consistent growth laws in a mixture context	1036
23.1.1	The mixture as a whole	1036
23.1.2	Growth laws for constituents based on quadratic dissipation	1040
23.1.3	The dissipation inequalities in the intermediate configurations	1041
23.1.4	Constituents with evolving microstructure: options	1042
23.2	Modes of mass deposition in an elastic-growing mixture	1046
23.2.1	The constituent is deposited in a natural configuration	1047
23.2.2	The constituent is deposited with the properties at the deposition site	1047
23.2.3	The expression for the stress	1047
23.3	The fixed charge: electro-chemomechanical couplings	1048
23.4	Growth equations with an evolving microstructure	1050
23.4.1	The free energy in terms of director vectors	1050
23.4.2	Rate of growth	1052
23.4.3	Rate of structure variables	1054
23.4.4	Evolution of the fiber directions $\mathbf{m}_{\kappa i}$, for $i \in [1, n_e]$	1055
23.4.5	Evolution of the relative volume fractions $\tilde{n}_{\kappa i}$, for $i \in [1, n_e]$	1057
23.4.6	Evolution of the pyridinoline crosslink density	1058
23.4.7	Evolution of the cell energy source	1059
23.4.8	Gathering the contributions to the dissipation inequality	1061
23.5	Growth equations for proteoglycans	1061
23.5.1	The free energy	1061
23.5.2	Rate of growth and rates of structure variables	1062
23.5.3	Evolution of the cell energy source	1063
23.5.4	Gathering the contributions to the Clausius-Duhem inequality	1064
23.6	Summary of constitutive equations and residual	1064
23.7	Growth laws with evolving microstructure: simulations	1066
23.7.1	Physical and constitutive parameters	1066
23.7.2	The reference isotropic configuration	1067
23.7.3	Initial data	1069
23.7.4	Boundary conditions	1069
23.7.5	Asymptotic properties of the growth law	1071
23.7.6	Sequential growth of PGs and collagen	1072

23.7.7	Stiffening of collagen by pyridinoline	1074
23.7.8	Directional distribution of collagen network	1074
23.7.9	Growth and resorption	1075
23.7.10	Dissipations and structuration damping	1078
23.7.11	Influence of the initial cell energy density	1079
23.8	Self-healing in engineering materials	1080
24	Solid tumors	1083
24.1	Solid tumors: the recent intrusion of mechanics	1084
24.2	From DNA alteration to metastatic migration	1086
24.3	Oncology and molecular basis of cancer	1089
24.3.1	Tissue composition	1089
24.3.2	Normal cellular cycle	1091
24.3.3	Formation of tumor cells	1093
24.3.4	Physiological consequences of the presence of tumor cells	1094
24.3.5	Tissue modification and capsule formation	1095
24.3.6	Angiogenesis and lymphangiogenesis	1095
24.3.7	Some therapies	1097
24.4	Mechanobiology: molecular basis and observations	1100
24.4.1	Mechanosensitive candidates	1100
24.4.2	Effects of fluid pressure and mechanical stress	1101
24.5	Early mathematical models of tumor growth	1102
24.5.1	Residual stresses	1102
24.5.2	Spherical models	1103
24.5.3	Criterion for necrosis	1104
24.5.4	Mixture models of mathematical flavor	1104
24.6	Models of transport of fluids, nutrients and drugs	1108
24.6.1	Influence of the microstructure	1108
24.6.2	Hydraulic permeability and diffusion coefficients in tumors	1108
24.6.3	Models that include nutrients	1109
24.6.4	Models that include drug delivery aspects	1109
24.6.5	Models that include pH influence	1111
24.6.6	Special effects	1112
24.7	Mechanical boundary value problems	1112
24.7.1	Cylindrical problems	1112
24.7.2	A sphere or spherical shell under purely radial displacement	1115
24.8	Poroelastic mixture models without growth strain	1118
24.8.1	A two phase poroelastic tissue with external mass exchanges	1118
24.8.2	A three phase poroelastic tissue with internal mass exchanges	1126
24.8.3	Infusion length in a three phase poroelastic tissue	1130
24.9	Poroelastic mixture models with a growth strain	1132
24.9.1	A two phase model including a growth strain and nutrients	1132
24.9.2	A two phase model including the effects of lymphatics	1135
24.10	Methods of imaging transport and mechanical properties	1137
24.10.1	Basic ideas	1137
24.10.2	Tumor tissues have distinct elastic and transport properties	1138
24.10.3	Ultrasonic techniques provide local strain	1138
24.10.4	MR elastography (MRE) provides wave-length	1138
24.10.5	Ultrasound and Computer Tomography (CT) for blood flow imaging	1138
24.10.6	Inverse analysis based on surface measurements	1139
24.10.7	Imaging poroelastic properties	1139
24.10.8	Extracting information by minimization	1140
25	Units and physical constants	1143
25.1	Units	1143
25.1.1	Basic units	1143
25.1.2	Standard units	1143

25.1.3 Non standard units	1144
25.2 Physical constants	1144
