Contents

	Page
Contents	4
1 Biomechanical topics in soft tissues	7
I Solids and multi-species mixtures as open systems : a continuum mechanics perspective	19
2 Elements of continuum mechanics	21
3 Thermodynamic properties of fluids	79
4 Multi-species mixtures as thermodynamically open systems	113
5 Anisotropic and conewise elasticity	149
6 Hyperelasticity, a purely mechanical point of view	193
7 Poroelasticity with a single porosity	219
8 Viscoelasticity and poro-viscoelasticity	265
9 Thermoelasticity and thermo-poroelasticity	305
10 Transfers of mass, momentum and energy	341
11 Waves in thermoelastic solids and saturated porous media	375
II Electro-chemomechanical couplings in tissues with a fixed electrical charge	447
12 Directional averaging for fiber-reinforced tissues	449
13 Electro-chemomechanical couplings	475
14 Chemomechanical couplings in articular cartilages	525
15 Passive transport in the interstitium and circulation	577
16 Coupled transports in tissues with a fixed electrical charge	641
17 Effects of the pH on transport and mechanics	679
18 Finite element analysis of ECM couplings	725

19 Cornea and annulus fibrosus	759
III Growth of biological tissues	867
20 Tissue Engineering	869
21 Growth of soft tissues	913
22 Elastic-growing solids	969
23 Elastic-growing mixtures	1019
24 Solid tumors	1067
25 Units and physical constants	1127
Bibliography	1131
Index	1183
